

Names: Katie Brickner, Matthew Heseltine, Beck Williams, Jaeger Nelson

The use case I am using is the user matching system. The user should be able to get a list of possible roommates that best suit them based on the answers on the survey. The user can take the general survey, get matches, generating, and getting the list. The user can also edit the survey and regenerate the list if they don't like their matches. They also have the option to generate the full list of matches if the top shown ones are not to their liking.
