This is the component diagram for the roommate finder application. It consists of two nodes. The larger of the two representing the main system that the software is running off of and the other as the sever which will be hosting information such as the list of questions for surveys, saved user information, as well as the data set containing all roommate survey results. The main system node contains components that carry out the three surveys the software provides which is mediated by a survey hub and a controller that lies between the user interface.
